human. Detection of toxic mercury species in blood samples is an important research focus in mercury exposure and health effects. This study was designed to investigate the in vitro effects of HgCl₂ and methylmercury (MeHg) on the concentrations of total mercury (THg), and the relevance of THg determination in blood samples in vitro to the serum THg determination in vivo, as well as to investigate the potential release of mercury by the two compounds from the polypropylene tubes containing the

mercury compound. Results showed that exposure of the polypropylene tubes to the mercury compounds resulted in significant decrease of THg in the solutions, and this would be even more pronounced if the serum samples were diluted to the ratio of 5:1 or 1:5. In comparison, the potential release of mercury from the THg-containing polypropylene tubes was negligible. These findings suggest that in vitro determination of THg in blood samples is not recommended for human, although it is still useful for assessment of the level of THg in

individual serum samples for research purposes. Investigation of an RNA sequence coding for the lipase of *Yarrowia lipolytica* by means of an oligodeoxynucleotide probe. An oligodeoxynucleotide sequence coding for the complete lipase of *Yarrowia lipolytica* was synthesized. The purified oligonucleotide was used as a probe for hybridization with DNAs from *Y. lipolytica* and from *Aspergillus*, *Rhizopus*, *Penicillium*, and *Mucor* species. A lipase gene homologous to that of *Y. lipolytica* was detected only in *Y. lipolytica* and

Aspergillus. Remember when Apple was actually a company that made products with style, and not just an annoying company that makes phones that look like the Kindle? It's not too early to believe that's going to happen again. The iPad
